100% water proof Rigidplank floors with Co-Extrusion technology.

About Uptons Rigid Plank

Upton's commitment to quality continues with the latest revolution in flooring - Rigid Plank. Rigid Plank is 100% waterproof and has 6 amazing colours - which you will struggle to distinguish from real timber.

Manufactured using a proprietary 'co-extrusion' technology, Rigid Plank has the most stable and waterproof core of any flooring worldwide. A big claim which is justified by test results and the skillset of our engineers when directed to develop a waterproof, stable flooring to meet everyday needs of everyday consumers.

While the formula of Rigid Plank is a proprietary secret, in general terms it's success is a result of blending specific stone powders and vinyl polymers together and then extruding as a continuous sheet of Rigid Plank.

Design excellence is one thing, but translating that ambition into a practical use solution is always a challenge. The Rigid Plank design philosophy of excellence is synonymous with that of our company.

Rigid Plank uses Co-Extrusion technology to ensure the core is extremely stable to withstand the Australian climate. The industry-leading stable core also helps ensure that click systems don't break when installing.

Rigidplank has all the features & benefits that you need to transform your home. With easy maintenance & water proof properties, Rigid Plank will make your installation gorgeous and care free.

Rigid Plank Maintenance

Rigid Plank doesn't trap dirt like many natural and fabric materials. Rigid Plank is treated with an enhanced surface coating. It also means that the floor does not need to be sealed after installation. The Rigid Plank surface protection system is built into the Ecotecture technology and provides a hygienic and durable finish that will protect your floor for years to come.

Cleaning after installation

1. Remove all loose debris from the floor using a vacuum, brush or dust mop (if using a vacuum, please check the manufacturer's guidelines to make sure it's suitable for Rigid Plank).
2. Ensure that all dry adhesive is removed from the surface.
3. Damp mop with a pH neutral detergent or if machine cleaning (no greater than 175rpm) use a 3M red pad (or equivalent) or scrubber dryer to clean the floor.

Routine maintenance

The commercial cleaning and maintenance regime is simple and can be carried out by hand or using mechanical cleaning apparatus.

1. Vacuum, sweep or mop to remove all dust and loose debris (if using a vacuum, please check the manufacturer's guidelines to make sure it's suitable for Rigid Plank).
2. Damp mop with a neutral detergent or if machine cleaning (no greater than 175rpm) use a 3M red pad (or equivalent) or scrubber dryer to clean the floor.
3. Stubborn stains can be removed by spot cleaning with concentrated neutral detergent and a 3M red pad (or equivalent).

Helpful tips

- Avoid dragging or sliding heavy items of furniture, carousels and point of sale across the floor.
- It is important when designing an installation that the appropriate entrance matting systems are used. Most manufacturers recommend a total of six paces, though this of course is dependent on the application and the space available. At the very least we recommend a non-rubber back matting such as Turtle Mats.
- Mop up spillages quickly to prevent stains.
